

Temple University Hospital Boiler Room

Philadelphia, PA

This may just look like an ordinary 5,000 sq ft boiler room, but this particular boiler room produces steam that heats hot water for an entire hospital campus; Temple University Hospital.

Temple University Hospital Boiler Room included demolition, roof restoration, asbestos abatements, concrete foundations, masonry restoration, and the installation and grading of structural steel catwalks, and handrails. At Caritas, we understand the importance of this project and prioritized the minimization of distribution to the facility.
